Note=No experimental confirmation available;
TISSUE SPECIFICITY: Ubiquitous; highest levels in testis.
PTM: Upon insulin-stimulation, phosphorylated on serine by MAPK kinases.
PTM: ADP-ribosylated (-auto).
SIMILARITY: Belongs to the PARP family.
SIMILARITY: Contains 15 ANK repeats.
SIMILARITY: Contains 1 sterile alpha motif (SAM) domain.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          nicotinamide + {ADP-D-ribosyl}{(N+1)-acceptor.

SUBNNTT: Oligomerizes and associates with TWKS2. Interacts with the Cytoplasmic domain of LNPEP/Otase in SLC2A4/GLUT4-vesicles. Binds to the N-terminus of telomeric TRF1 via the ANK repeats. SUBCELLULAR LOCATION: Cytoplasmic, associated with the Golgi and with juxtanuclear SLC2A4/GLUT4-vesicles. A minor proportion is also found at nuclear pore complexes and around the pericentriolar matrix of mitotic centromeres. During interphase, a small fraction of TNKS is found in the nucleus, associated with TRF1.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        PER-TIM (BY SIMILARITY)
MISCELLANEOUS: THE SEQUENCE SHOWN IS THAT OF STRAIN ATI
SIMILARITY: Contains 2 PAS (PER-ARNY-SIM) dimerization
SIMILARITY: Contains 1 PAS-associated C-terminal (PAC)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             translocates into the nucleus (By similarity).
SUBCELLULAR LOCATION: Nuclear at specific periods of the
First accumulates in the perinuclear region about one hou
translocation into the nucleus. Interaction with Tim is r
for nuclear localization (By similarity).
FTM: PHOSPHORYLATED WITH A CIRCADIAN RHYTHMICITY, PROBABL
DOUBLE-TIME PROTEIN (DBT). PHOSPHORYLATION COULD BE IMPLI
THE STABILITY OF DER MONOMER AND IN THE FORMATION OF HETE
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               rhythmic component of the male courtship song that originates in the thoracic nervous system. The biological cycle depends on the rhythmic formation and nuclear localization of the TIM-PER complex. Light induces the degradation of TIM, which promotes elimination of PER. Nuclear activity of the heterodimer coordinatively regulates PER and TIM transcription through a negative feedback loop. Behaves are negative element in circadian transcriptional loop. Does not appear to bind DNA, suggesting indirect transcriptional inhibition (By similarity).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       period length of circadian and ultradian rhythms; an increase in PER dosage leads to shortened circadian rhythms and a decrease leads to lengthened circadian rhythms. Essential for the circadian rhythmicity of locomotor activity, eclosion behavior, and for the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Biol. Evol. 10:127-139(1993).
FUNCTION: Essential for biological clock functions.

```

The present invention describes a recombinant agfA gene (I) where a segment of the gene has been replaced by a segment of a foreign DNA sequence which encodes a foreign epitope or antigen. Also described are: (1) use of thin aggregative fimbriae (SEF17/TAF) nucleation depended assembly system of strains of Salmonella, Escherichia coli and Enterobacteriaceae for the production of finbriae comprising recombinant AgfA, CsgA and AgfA-homologue fimbrin subunits, respectively; (2) directing recombination of a recombination of the homologous species; (3) directing recombination of a recombinant gene back into the chromosome of the homologous species, replacing the native

Recombinant agfA gene having a segment replaced by a foreign DNA sequence which encodes foreign epitope or antigen, expresses recombinant AgfA protein useful for eliciting immune response in animal.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  copy of that gene; and (4) eliciting an immune response in an animal, comprising separating an amino acid polymer comprising a recombinant AgfA protein containing a replacement segment or segments of foreign amino acid sequence or sequences grown on a Salmonella, E. coli or Enterobacteriaceae host cell, from the host cell and introducing the polymer into the animal in conjunction with a carrier or diluent. (I) is useful for the expression of recombinant AgfA protein which is useful for eliciting an immune response in an animal. In a fimbrial presentation system the heterologous antigens are presented in high numbers (up to 500,000 copies/cell), the hybrid fimbrin protein possesses both the immunogenicity and adhesion properties relevant for an efficient live vaccine, the carrier fimbrial subunit proteins are usually strong immunogens, which may be important for directing an immune response against the inserted epitope, and hybrid fimbriae are easy and inexpensive to purify in large amount. The present sequence is given in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Matches

            The present invention describes a recombinant agfA gene (I) where a segment of the gene has been replaced by a segment of a foreign DNA sequence which encodes a foreign epitope or antigen. Also described are: (1) use of thin aggregative fimbriae (SERI//TAF) nucleation depended assembly system of strains of Salmonella, Escherichia coli and Enterobacteriaceae for the production of fimbriae comprising recombinant AgfA. CegA and AgfA-homologue fimbrin subunits, respectively; (2) directing recombination of a recombinant gene into the chromosome of the homologous species; (3) directing recombinant gene into the chromosome of the homologous species, replacing the native compositing separating an amino acid polymer comprising a recombinant AgfA protein containing a replacement segment or segments of foreign amino
   protein containing acid sequence or so
                                                                                                                                                                                                                                                                                                                                                                                                                                Disclosure; Page 135; 139pp; English.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Recombinant agfA gene having a segment replaced by a foreign DNA sequence which encodes foreign epitope or antigen, expresses recombinant AgfA protein useful for eliciting immune response in animal.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         WPI; 2000-672631/65.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Enterobacteriaceae host cell, from the host cell and introducing the polymer into the animal in conjunction with a carrier or diluent. (I) useful for the expression of recombinant AgfA protein which is useful eliciting an immune response in an animal. In a fimbrial presentation system the heterologous antigens are presented in high numbers (up to 500,000 copies/cell), the hybrid fimbrin protein possesses both the immunogenicity and adhesion properties relevant for an efficient live vaccine, the carrier fimbrial subunit proteins are usually strong immunogens, which may be important for directing an immune response against the inserted epitope, and hybrid fimbriae are easy and inexpensive to purify in large amount. The present sequence is given in the accompliance of the present sequence is given in the accompliance of the present sequence is given in the accompliance of the present sequence is given in the accompliance of the present sequence is given in the accompliance of the present sequence is given in the present sequence is given in the accompliance of the present sequence is given in the present sequence is given in the present sequence is given in the present sequence is given in the present sequence is given in the present sequence is given in the present sequence is given in the present sequence is given in the present sequence is given in the present sequence is given in the present sequence is given in the present sequence in given in the present sequence is given in the present sequence in given in the present sequence is given in the present sequence in given in the present sequence is given in the present sequence in given in the present sequence is given in the present sequence in given in the present sequence is given in the present sequence in given in the present sequence is given in the present sequence in given in the present sequence in given in the present sequence in given in the present sequence in given in the present sequence in given in the present sequence in given in the present seq
The present sequence represents agfA encoded derived from Salmonella enteritidis 27655-3b.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               26-APR-1994;

It can also be used to provide proteins and antibodies which can be used for assays. The nucleic acid sequence can be used to provide probes or primers which can specifically hybridise to nucleic acid molecules from greater than 99% of Salmonella strains that are pathogenic to warm-blooded animals relative to nucleic acid molecules from virtually all other microbial organisms. (Updated on 25-MAR-2003 to correct PF field.)
                            The present invention describes a recombinant agfA gene (1) where a segment of the gene has been replaced by a segment of a foreign DNA seguence which encodes a foreign epitope or antigen. Also described a segment of thin aggregative fimbriae (SEF17/TAF) nucleation depended assembly system of strains of Salmonella, Escherichia coli and assembly system of strains of Salmonella, Escherichia coli and assembly system of strains of Salmonella, Escherichia coli and assembly system of strains of Salmonella, Escherichia coli and assembly system of strains of Salmonella, Escherichia coli and system of strains of Salmonella, Escherichia comprising recombinate comprising recombinate comprising recombinate comprising recombinate comprising recombinate comprising recombinate comprising recombinate comprising recombinate comprising recombinate comprising recombinate comprising recombinate comprising recombinate comprising recombinate comprising recombinate comprising recombinate comprising recombinate comprising recombinate comprising recombinate comprising recombinate comprising recombinate comprising recombinate comprising recombinate comprising recombinate comprising recombinate comprising recombinate comprising recombinate comprising recombinate comprising recombinate comprising recombinate comprising recombinate comprising recombinate comprising recombinate comprising recombinate comprising recombinate comprising recombinate comprising recombinate comprising recombinate comprising recombinate comprising recombinate comprising recombinate comprising recombinate comprising recombinate comprising recombinate comprising recombinate comprising recombinate comprising recombinate comprising recombinate comprising recombinate comprising recombinate comprising recombinate comprising recombinate comprising recombinate comprising recombinate comprising recombinate comprising recombinate comprising recombinate comprising recombinate comprising recombinate comprising recombinate comprising recombinate comprising recombinate comprisi
                                                                                                                                                                                                                                                                                                                                                                              Recombinant agfA gene having a segment replaced by a foreign DNA sequence which encodes foreign epitope or antigen, expresses recombinant AgfA protein useful for eliciting immune response in animal.
                                                                                                                                                                                                                                                                                                             Disclosure; Page 136; 139pp; English.

                                                                                                                                                                                                                                                                                                                                                                                                                                          The present invention describes a recombinant agfA gene (I) where a CC segment of the gene has been replaced by a segment of a foreign DNA CC sequence which encodes a foreign epitope or antigen. Also described are: (1) use of thin aggregative fimbriae (SEF17/TAF) nucleation depended CC assembly system of strains of Salmonella, Escherichia coli and CC AgfA, CsgA and AgfA-homologue fimbria subunits, respectively; (2) directing recombination of a recombinant gene into the chromosome of the homologous species; (3) directing recombinant gene into the chromosome of the homologous species, replacing the native copy of that gene; and (4) eliciting an immune response in an animal, comprising separating an amino acid polymer comprising a recombinant AgfA protein containing a replacement segment or segments of foreign amino acid sequence or sequences grown on a Salmonella, E. coli or Enterobacteriaceae host cell, from the host cell and introducing the polymer into the animal in conjunction with a carrier or diluent. (I) is useful for the expression of recombinant. In a fimbrial presentation system the heterologous antigens are presented in high numbers (up to 500,000 copies/cell), the hybrid fimbrin protein see usually strong communogenicity and adhesion properties relevant for an efficient live vaccine, the carrier fimbrial subunit proteins are usually strong the insurance in a fimbriae are easy and communogens, which may be important for directing an immune response in an informative response in a more amount. The present account of civen in

                                                                                                                                                                                                                                                                                                                                               The present invention describes a recombinant agfA gene (1) where a CC segment of the gene has been replaced by a segment of a foreign DNA CC sequence which encodes a foreign epitope or antigen. Also described are: CC (1) use of thin aggregative fimbriae (SEF1/TAF) nucleation depended CC assembly system of strains of Salmonella, Escherichia coli and CC Enterobacteriaceae for the production of fimbriae comprising recombinant CA AgfA, CSGA and AgfA-homologue fimbrin subunits, respectively; (2) CC directing recombination of a recombinant gene into the chromosome of the homologous species; (3) directing recombination of a recombinant gene CC back into the chromosome of the homologous species; (3) directing an immune response in an animal, CC comprising separating an amino acid polymer comprising a recombinant AgfA CC comprising separating an amino acid polymer comprising a recombinant AgfA CC comprising separating an amino acid polymer comprising a recombinant AgfA CC comprising a requences grown on a Salmonella, E. coli or CC acid sequence or sequences grown on a Salmonella, E. coli or CC useful for the expression of recombinant AgfA protein which is useful for the expression of recombinant AgfA protein which is useful for celiciting an immune response in an animal. In a fimbrial presentation CC system the heterologous antigens are presented in high numbers (up to companion to a state of the part of the possesses both the communication that the presentation protein can efficient live

                                                                                                                                                                                            CC assembly system of strains of Salmonella, Escherichia coli and CR Enterobacteriaceae for the production of fimbriae comprising recombinant CR Agfa, CsgA and Agfa-homologue fimbria subunits, respectively; (2) CC directing recombination of a recombinant gene into the chromosome of the homologous species; (3) directing recombinant gene into the chromosome of the homologous species, replacing the native CC copy of that gene; and (4) eliciting an immure response in an animal, CC comprising as replacement segment or segments of foreign amino acid polymer comprising a recombinant Agfa coli sequence or sequences grown on a Salmonella, E. coli or Enterobacteriaceae host cell, from the host cell and introducing the useful for the expression of recombinant Agfa protein which is useful for copiumer into the animal in conjunction with a carrier or diluent. (I) is celliciting an immure response in an animal. In a fimbrial presentation composes/celly, the hybrid fimbrin protein possesses both the immunogens, which may be important for directing an immune response conspines the inserted epitope, and hybrid fimbriae are usually strong immunogens, which may be important for directing an immune response conspines the inserted epitope, and hybrid fimbriae are easy and conspined the presention of the present sequence is given in the presention of the presention of the presention. The present sequence is given in the presention of the presention of the presention of the presention.
